

Bulk goods wagons for transporting powders (powder wagons)

Uacns / RandomSkin

Names in RW:

L59 Uacns

The powder wagon is a special form of bulk goods wagon designed to transport goods in powder form. These wagons are pneumatically unloaded, usually by using compressed air. For goods that might react with oxygen in the compressed air, nitrogen is used instead. These wagons are used for bulk commodities, such as cement, that are so fine-grained they cannot be poured, or at least do not pour very well, and so cannot be emptied under gravity.

The freight wagons use the vR Feature RandomSkin.
All freight wagons in this package use automatic train back plates.

RandomSkin: When the wagons are placed the wagons texture will change in between 5 seconds to one out of four possible.

Links for QuickDrive are included in the package.
